

ATN 164: Screen to Prevent Summary

Study Description

Screen to Prevent (S2P) takes place in pediatric Emergency Departments (ED), and the main goal is to **increase HIV screening rates** among youth and **find out the best way** to do so.

We will use a computerized survey to **find youth that might qualify for Pre-Exposure Prophylaxis (PrEP)** - medication to prevent HIV. The study will also use a **texting tool to help youth get started on PrEP** and connected to care. This study is for most youth that come into pediatric EDs.

Why is this study important?

We hope S2P will be an important step towards **more young people getting tested for HIV** and started on PrEP or HIV treatment, if needed, in the ED - which is **the only place many teens get healthcare**.

Who may be eligible?

Anyone ages 14-24 who is not living with HIV

Where is the study enrolling?

Atlanta | Emory University

Baltimore | Johns Hopkins University

Houston | Baylor College of Medicine

Memphis | St. Jude Children's Research Hospital

Tampa | University of South Florida
